Concept	Description
Research Problem	A statement that motivates the research presented in a publication, such as a research gap.
Research Question	A clearly formulated question that guides the study and defines what the researchers aim to answer.
Research Goal	A broader study objective, such as improving predictive performance, reducing latency, or evaluating scalability.
Research Object	The central object of investigation in a publication. Authors typically state the research object explicitly.
Artifact/Contribution	A systematically developed output of a research process, such as a method, implementation, or empirical finding.
Investigated Property	A specific property of a research object that is evaluated by the authors, such as feasibility, performance, or robustness. Multiple properties may be investigated.
Hypothesis	A precise, testable statement about the expected outcome of a study.
Type of Hypothesis	The specific type of hypothesis, such as a null or alternative hypothesis.
Data Collection	The research process of collecting data is used to generate evidence about the research topic.
Data Collection Method	The systematic approach used to collect data, for example, a survey, experiment, or observation.
Data Artifact	Any data that has been collected, observed, generated, created, or reused to support original research findings.
Type of Data Artifact	A classification of the data artifact, for example, as qualitative or quantitative, real-world or synthetic, or as a mathematical formula.
Source Identifier	A unique identifier that enables the retrieval of data, such as a URL or DOI.
Data Analysis	The process of systematically applying statistical, computational, or logical techniques to describe, summarize, and interpret data.
Data Analysis Method	The systematic approach used to analyze data and derive results.
Result	The research outcome or finding derived from the data analysis process or the study as a whole.
Threats to Validity	Reported limitations that may affect the validity, soundness, interpretation, or generalizability of research results.
